

ABSTRACT

A method for knitting a glove is provided in which the glove is knitted by using a flat-knitting device including
5 at least a pair of front and back needle beds which extend in a horizontal direction while facing each other from front and back directions, at least one of the front and back needle beds being movable horizontally in a racking motion, the flat-knitting device capable of transferring
10 stitches between the front and back needle beds. The method includes the steps of knitting a four-finger body through which a little finger, a ring finger, a middle finger, and an index finger are to be inserted; performing a rotational operation before joining the four-finger body
15 with a thumb sheath, the rotational operation being performed by transferring stitches of the four-finger body held by knitting needles to free needles and moving at least one of the front and back needles beds in a racking motion so as to rotate the four-finger body towards
20 knitting needles holding stitches of the thumb sheath; and joining the four-finger body with the thumb sheath.
